

# Exploratory Data Analysis of NANSE Sales Data

Stephen Bernardo

10/30/2023

## Loading the necessary packages

```
# Load any libraries here
```

```
library(ggplot2)
```

```
library(dplyr)
```

```
##
```

```
## Attaching package: 'dplyr'
```

```
## The following objects are masked from 'package:stats':
```

```
##
```

```
##   filter, lag
```

```
## The following objects are masked from 'package:base':
```

```
##
```

```
##   intersect, setdiff, setequal, union
```

```
library(tidyverse)
```

```
## -- Attaching core tidyverse packages ----- tidyverse 2.0.0 --
```

```
## v forcats   1.0.0   v stringr   1.5.0
```

```
## v lubridate 1.9.2   v tibble   3.2.1
```

```
## v purrr     1.0.2   v tidyr    1.3.0
```

```
## v readr     2.1.4
```

```
## -- Conflicts ----- tidyverse_conflicts() --
```

```
## x dplyr::filter() masks stats::filter()
```

```
## x dplyr::lag()     masks stats::lag()
```

```
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

## Loading the Nanse store Data

```
df <- read.csv('store_3HE.csv')
```

## Understanding the data structure of raw data

```
#Understanding the data structure
```

```
str(df)
```

```
## 'data.frame':   771 obs. of  20 variables:
```

```

```
#Using n_distinct function  
n_distinct(df)
```

```
## [1] 771
```

Brief summary of what I learned.

1. There are 771 observations and 20 variables. Out of the 20 variables, one variable named **revenue** is a character type, which means it needs to be converted to numerical type.
2. One variable named **size** has 15 null values, indicated by the NA's in the summary results. Hence, this column will need to be deleted in Task 4.

## Converting revenue to numeric data type

```
df$revenue <- as.numeric(df$revenue)
```

```
## Warning: NAs introduced by coercion
```

## Deleting rows with missing values

```
df_new <- na.omit(df)
```

## Creating the df\_low and df\_high data frames

**df\_low** contains data on all the stores with revenue less than the average revenue for the complete data set (df\_new)

**df\_high** contains data on all the stores with revenue more than the average revenue for the complete data set (df\_new)

```
df_high <- df_new %>% filter(revenue > mean(df_new$revenue))
```

```
df_low <- df_new %>% filter(revenue < mean(df_new$revenue))
```

```
# Finding the mean  
mean(df_high$size)
```

```
## [1] 882.3274
```

```
mean(df_low$size)
```

```
## [1] 680.1287
```

Relationship between **revenue** and **size** based on means: There is a direct relationship between revenue and size, where we can see that stores **above the average revenue** (in df\_high dataframe) have a **larger average store size**. On the other hand, we can see that stores **below the average revenue** (in df\_low dataframe) have a **smaller average store size**.

## Correlation between revenue and size

```
#Calculating the correlation  
cor(df_new$revenue,df_new$size)
```

```
## [1] 0.6175055
```

```
#Plotting the relationship  
ggplot(df_new,aes(x=revenue,y=size)) + geom_point()
```

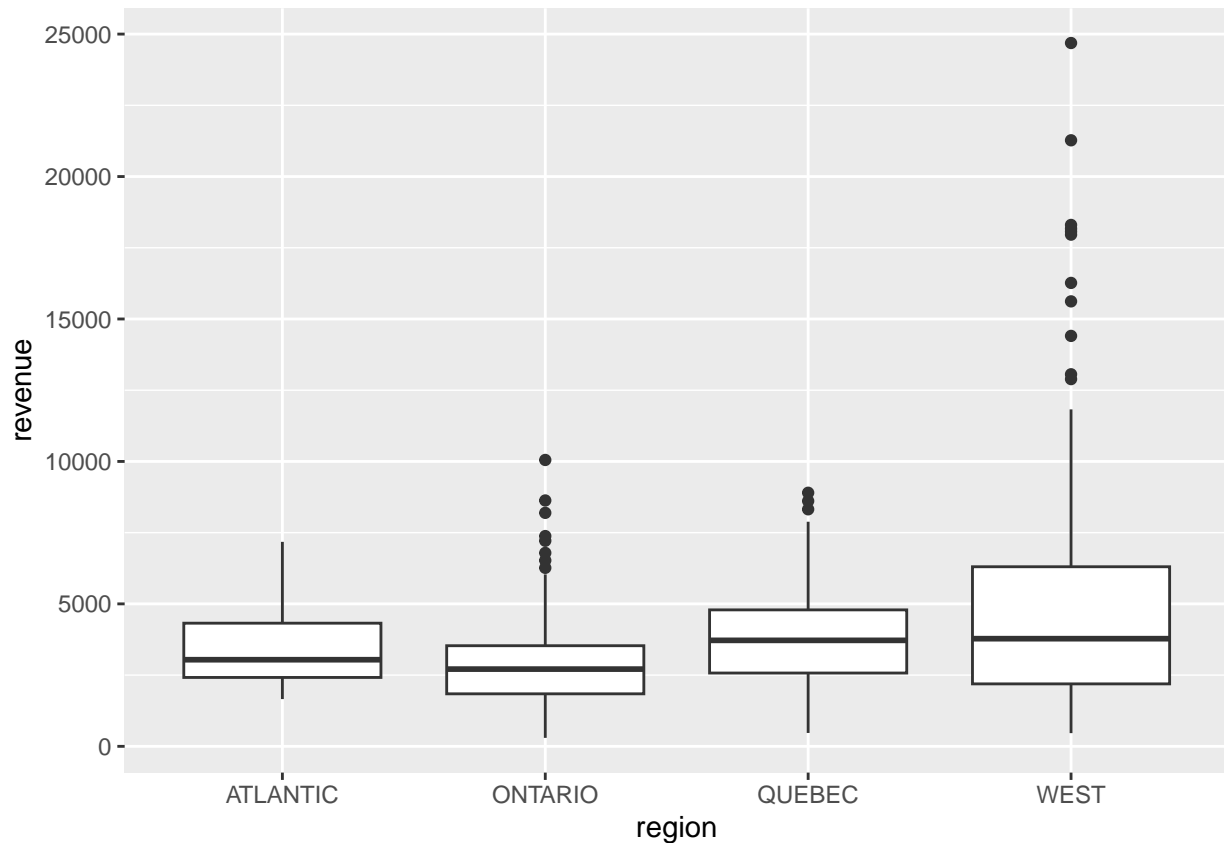

The output above shows that there is a positive relationship between revenue and size, where we see that there is a correlation coefficient of 0.61. In addition, we can see from the scatter plot that there is a positive relationship between revenue and size because we see that a higher revenue would mean a higher store size.

### Boxplots of revenue for each region

```
ggplot(df_new, aes(x=region, y=revenue)) + geom_boxplot()
```

Distribution of **revenue** within each **region**:

We can see that there is no significant difference between the median revenues for all regions. However, we can see from the box and whisker plot that there is a significant difference as to the mean and the number of outliers, especially in the **West** region.

**Bar chart of gross\_profit for each province**

```
ggplot(df_new, aes(x=province, y=gross_profit)) +  
  geom_col()
```

Based from the height of the bar charts, we can see that province ON has the highest amount of gross profit followed by QC and AB. On the other hand, the province with the lowest gross\_profit is PE.

### Correlation matrix of average store sales for product categories

```
df_filtered <- df %>%
  select(energy_units, regularBars_units, gum_units, bagpegCandy_units, isotonics_units, singleServePotato_units)
cor(df_filtered)
```

```

1. Product categories that sell together the least.

**gum\_units** and **psd591Ml\_units** with a correlation of **0.5951027**

2. Product categories that sell together the most.

**bagpegCandy\_units** and **takeHomePotato\_units** with a correlation of **0.9254152**
